

Deimonas Suchanka

Systems & Process Engineer | The Hague, Netherlands

EU Citizen • VOL-VCA • ds.suchanka@gmail.com • sorbieskis.github.io/portfolio • github.com/Sorbieskis

Analytical Systems Engineer who solves complex electro-mechanical problems through data-driven root cause analysis. My work has consistently involved engineering new processes and technical frameworks that deliver significant, quantifiable improvements in system performance and reliability.

KEY ENGINEERING PROJECTS

- **Pekos System RCA:** Diagnosed gain instability; improved force consistency by +350%.
- **QA Validation Framework:** Architected ISO 9001-aligned framework & SOP for knowledge capture.
- **"Enterprise Documentation Platform:** Architected and led the development of 'Project Unidoc,' a modular content platform to automate the generation of as-built technical manuals for highly configurable equipment.

PROFESSIONAL EXPERIENCE

Ventil Test Equipment BV

Service Engineer (Systems & Process Focus)

Den Haag, Netherlands

November 2024 – Present

- Executed a data-driven RCA on a critical clamping system, improving production consistency by +350%.
- Architected and implemented a "docs-as-code" workflow (Git, LaTeX) to serve as a single source of truth.
- Designed a tiered QA validation framework to formalize knowledge capture in line with ISO 9001 principles.

Fast & Fluid Management

Assembly Technician

Sassenheim, Netherlands

May 2024 – October 2024

- Assembled, tested, and troubleshoot complex mechanical and electrical dispensing systems independently.
- Performed quality control checks to ensure all machines met operational standards before shipping.

CERTIFICATIONS & CLEARANCES

VOL-VCA (Safety for Operational Supervisors)

EU/NATO Citizen, Lithuanian Armed Forces Veteran (2020-2021), Eligible for Security Clearance

CORE TOOLS

Git • MkDocs • LaTeX • progeCAD • Data-Driven RCA • ISO 9001 • VFD/PLC Tuning

EDUCATION

University of Amsterdam

Coursework toward Bachelor of Arts, European Studies

Amsterdam, Netherlands

2021 – 2022

- Developed strong academic writing and research skills.

Root Cause Analysis: Pekos Clamping System

Appendix: Case Study A

+350% Improvement in Force Consistency

Diagnosed a critical system instability and deployed a control solution that became the blueprint for data-driven analysis in the workshop.

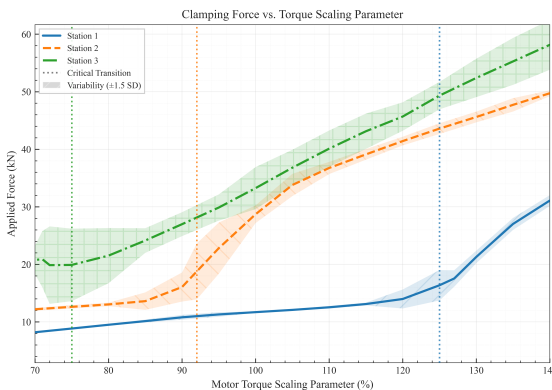

THE PROBLEM

A key clamping system exhibited severe force inconsistency, causing quality issues and line stoppages. My objective was to diagnose and resolve the instability using empirical data, as prior attempts had failed.

METHODOLOGY

- Data Acquisition:** Deployed sensors to capture real-time performance data and establish a quantitative baseline.
- Data Analysis:** Revealed a critical PID loop gain margin instability via time-series analysis in Python.
- Solution Development:** Engineered and validated a revised set of PID tuning parameters after modeling system dynamics.
- Deployment:** Implemented the validated parameters on the production machine and authored a new calibration SOP.

DATA VISUALIZATION

DELIVERABLES

Engineering Report	An 11-page IEEE-formatted report detailing the full RCA, methodology, and validated results.
QA Framework	A strategic proposal and lean SOP for formalizing knowledge capture under ISO 9001.
VFD Parameter Set	A finalized master list of station-specific inverter parameters to ensure stable machine operation.

Architecture: Tiered QA Validation Framework

Appendix: Case Study B

From Ad-Hoc to Standardized QA

Architected a new validation framework to move from basic functional checks to objective, data-driven quality assurance, addressing senior management’s goal for improved knowledge capture.

THE PROBLEM

Existing quality checks verified basic functionality but consistently missed subtle performance variations. This created three core business problems: a lack of objective QA data, no formal process for capturing engineering knowledge, and a gap in ISO 9001 alignment.

METHODOLOGY

- Foundational Analysis:** Leveraged findings from the Pekos system analysis to demonstrate the need for a more rigorous, data-driven validation process.
- Workflow Modeling:** Analyzed the existing ad-hoc workflow and designed a new, structured process with clear decision points and escalation paths.
- Framework Architecture:** Designed a tiered (L1-L3) system to efficiently handle routine QA checks as well as deep-dive root cause analysis for complex issues.
- Metric & Procedure Definition:** Defined specific, data-driven performance metrics (e.g., Consistency Index) and developed a lean, actionable SOP for Level 1 validation.

FRAMEWORK ARCHITECTURE

- Level 1: Routine Validation** | A lean, standardized procedure for commissioning engineers to perform data-driven pass/fail checks on all machines.
- Level 2: Targeted Diagnosis** | A focused investigation, triggered by a Level 1 failure, to quickly diagnose the issue and determine a corrective action.
- Level 3: Deep-Dive RCA** | A full, systematic root cause analysis involving a cross-functional team for complex issues, modeled on the Pekos investigation.

DELIVERABLES

QA Framework Proposal	A formal proposal outlining the tiered (L1-L3) framework, stakeholder impact, key metrics, and implementation plan.
Level 1 Test Procedure	A lean, single-page SOP for conducting routine performance validation in the workshop.
Data Template	An Excel template for data collection and automatic calculation of the Consistency Index (CI) metric during Level 1 tests.

Platform: Project Unidoc - Enterprise Documentation System

Appendix: Case Study C

Architecting an Enterprise Documentation Platform

Architected and led the development of a modern platform to replace a chaotic file-based process, enabling automated, as-built manual generation.

THE PROBLEM

The existing ad-hoc documentation process, based on scattered Word files, was a high-risk liability that could not scale to support the company’s strategic shift towards highly configurable products, creating a critical business bottleneck.

METHODOLOGY

- Prototyping & Validation (V1):** Built a functional MVP to prove the value of a "docs-as-code" approach and validate the core technical architecture (Git, Python, LaTeX).
- Stakeholder Buy-In:** Successfully presented the V1 prototype to senior management, securing approval and resources for the full-scale enterprise platform.
- Enterprise Architecture (V2):** Designed the V2 platform from first principles, focusing on a "Docs-as-BOM" model to solve the complex product configurability challenge.
- Full-Cycle Implementation:** Currently leading the V2 development, from back-end pipeline configuration to the front-end CMS user experience.

SOLUTION ARCHITECTURE

- Modular Content Model** | A version-controlled library of reusable components, assembled via a "Docs-as-BOM" YAML file that ensures as-built accuracy and links to P&ID revisions.
- Visual Assembly Workbench** | A custom-configured CMS (Decap) providing a "Word-like" experience for non-technical engineers to visually build manuals.
- Automated Publishing Pipelines** | A CI/CD system that automatically generates both print-ready PDFs (LaTeX) and static websites (MkDocs) from a single source of truth.

DELIVERABLES

Scalable Content Platform	A version-controlled system for managing a library of modular content components across all product lines.
Visual Assembly Workbench	A CMS interface configured for non-technical users to assemble manuals via a "Word-like" visual experience.
Automated Publishing Pipelines	Dual CI/CD pipelines that generate professional print (PDF) and web outputs from a single, structured source.

**Note: The system architecture and proprietary details are available to be discussed in depth during an interview.*
